Microservices

WICLO26WIC62

How did we get there?

We started with the monolith...

Monolith problems...

Slows our velocity getting into production.

Monolith problems...

Engineers take too long to ramp up.

Monolith problems...

The code base becomes too large for any one person to reason about.

Monolith problems...

Development *creates* change.

DBAs *resist* change.

Monolith problems...

Coordinated releases batch many changes together from different teams.

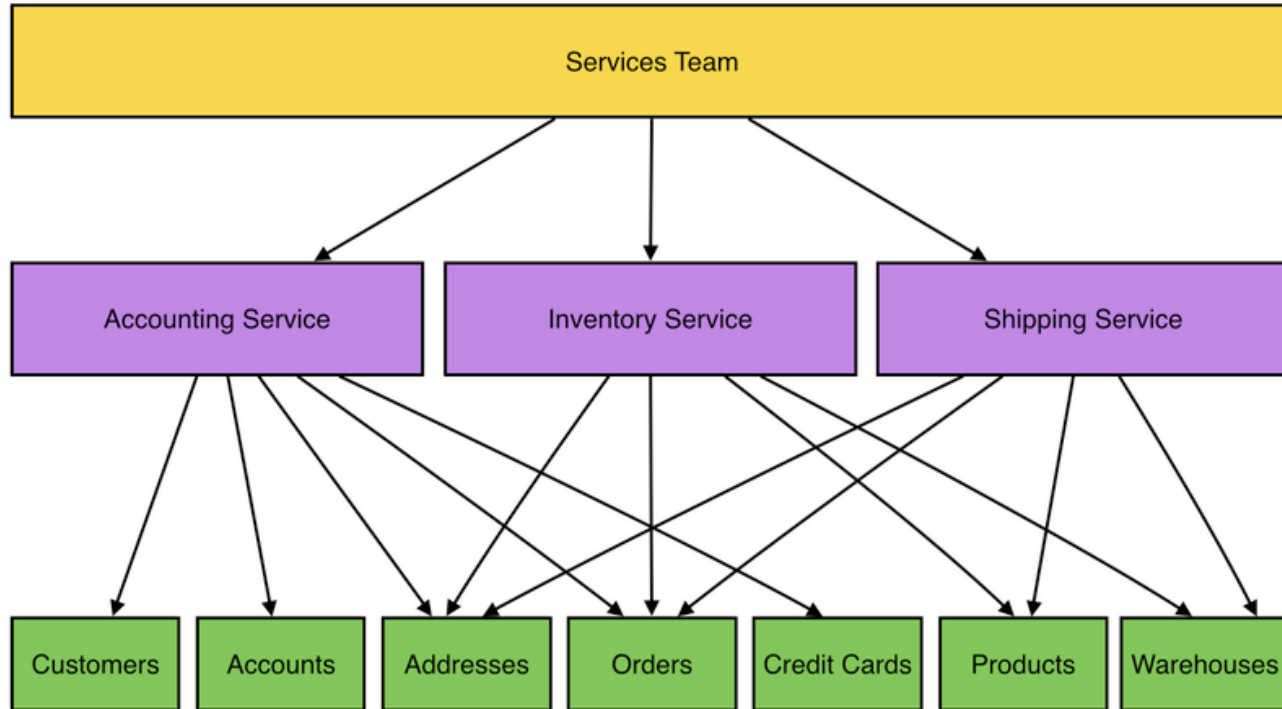

Monolith problems...

Operations drives the runtime environment of applications.

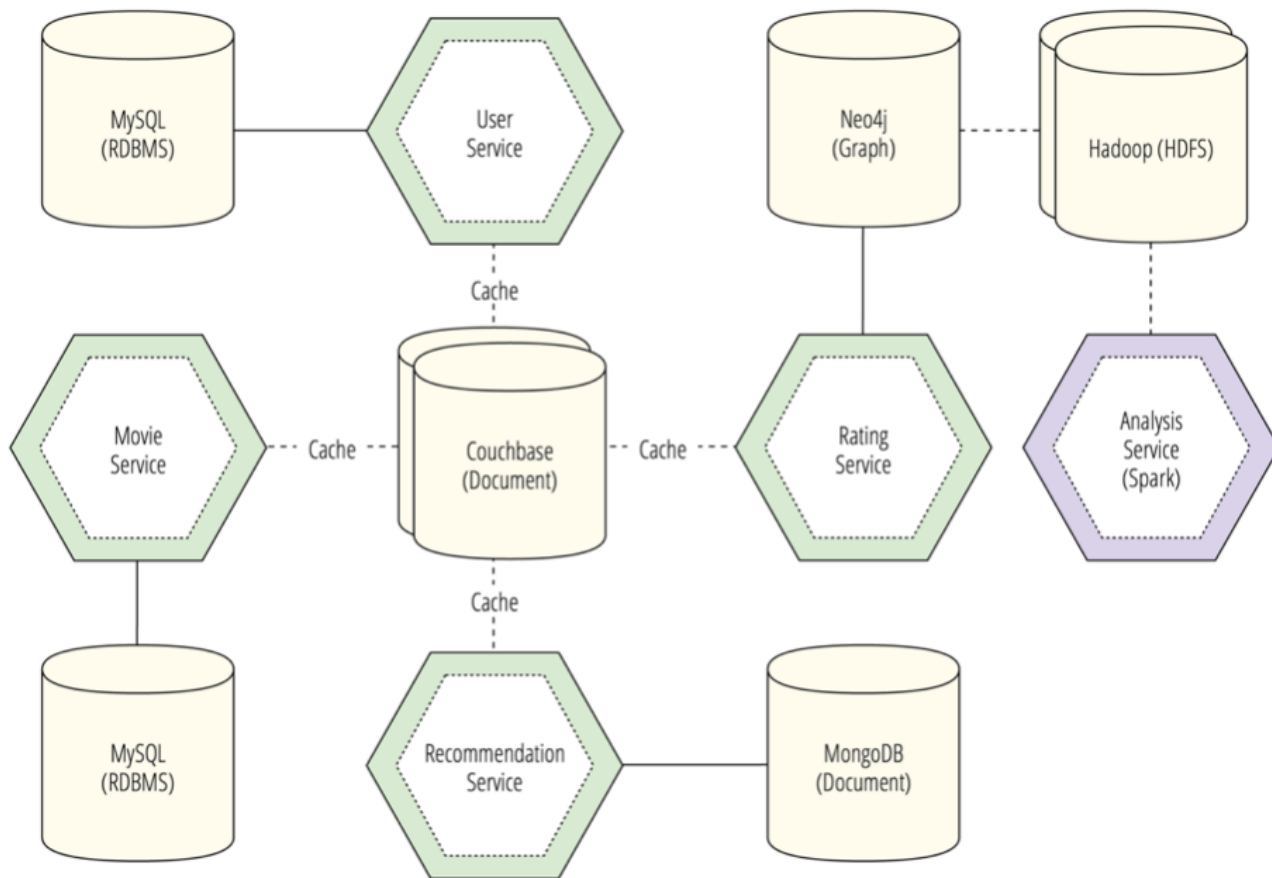

Monolith problems...

Deploy *everything* at once,
or *nothing* at all.

We then moved towards SOA...

We have now arrived at microservices...

Home / Products / Like a BOSH (T-Shirt, Women's Medium)

Summary

Product name:
Like a BOSH (T-Shirt, Women's Medium)

Price:
14.99

Product Details

The BOSH Outer Shell (**BOSH**) is an elegant release engineering tool for a more virtualized cloud-native age. The feeling of spinning up a highly available distributed system of VMs is second only to the feeling of frequently pushing code to production. Show the cloud *who's BOSH* with this stylish cloud native ops tee.

Cloud Native Tee Collection
99% YAML, 11% CLI
BOSH CCK *recommended*
4 nines of *re-washability*

Price: \$14.99

Product number: SKU-34563

Monolith to Microservice

Splitting the Monolith: User Service Migration

Microservice problems...

No foreign key constraints
between services.

Microservice problems...

I've got legacy problems.

Microservice problems...

What about my data
warehouse?

Microservice problems...

Teams are creating
redundant functionality.

Microservice problems...

Distributed transactions are brittle.

Microservice problems...

Every bug is a murder
mystery.

Microservice problems...

Distributed systems are
hard.

Without an **event-driven** architecture and a **cloud platform**...

Microservices will drown you in hard problems you never knew existed.

Spring Boot

A JVM micro-framework for building microservices

What is Spring Boot?

Phil Webb
@phillip_webb

Following

For those on reddit.com/r/java/ saying it's Spring Boot is “the framework for a framework” here's a diagram:

Spring Initializr for bootstrapping your applications

spring boot

supports rapid development of
production-ready applications
and services

The screenshot shows the Spring Initializr web application in a browser window. The browser's address bar shows 'start.spring.io'. The page has a dark header with the text 'SPRING INITIALIZR' and 'bootstrap your application now'. Below the header, there's a form to generate a project. The form is divided into two main sections: 'Project Metadata' and 'Dependencies'. In the 'Project Metadata' section, there are fields for 'Artifact coordinates' (Group: 'com.example', Artifact: 'demo', Name: 'demo', Description: 'Demo project for Spring Boot', Package Name: 'com.example'), 'Packaging' (set to 'Jar'), 'Java Version' (set to '1.8'), and 'Language' (set to 'Java'). In the 'Dependencies' section, there's a search bar with the text 'Web, Security, JPA, Actuator, Devtools...'. Below the search bar, there are five buttons: 'Web', 'JPA', 'Security', 'Actuator', and 'Rest Repositories'. At the bottom right of the form, there is a green button labeled 'Generate Project'.

Event-driven microservices

Implementing event-driven architectures in a distributed system

Event-driven microservices...

Events as a first-class
citizen.

Event-driven microservices...

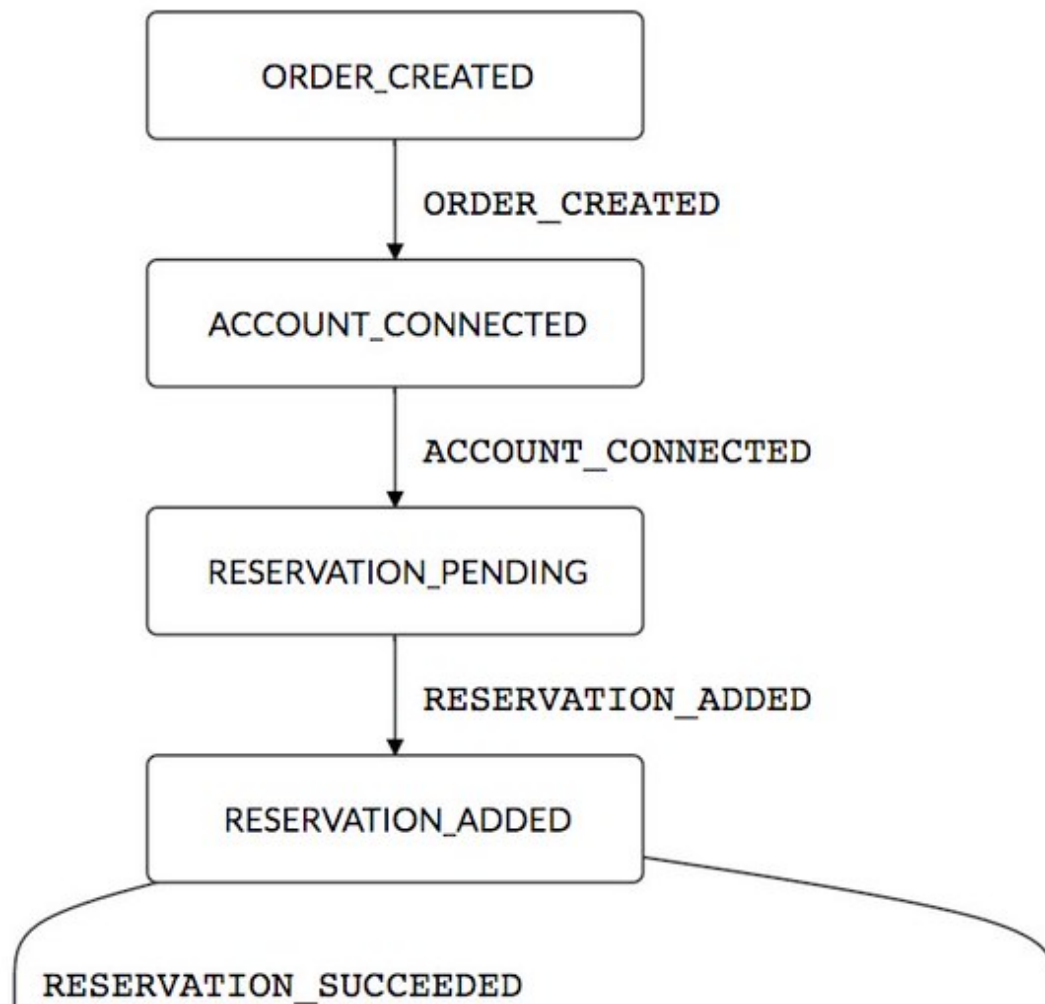

Domain events have a subject and contain immutable data.

Event-driven microservices...

Every domain event applies a state transition to an aggregate.

Event-driven microservices...

Domain events can only be applied if the aggregate is in a valid state.

Event-driven microservices...

Create meaningful exceptions if a domain event cannot be applied.

Event-driven microservices...

Event sourcing stores every state transition as an event in a log.

Event-driven microservices...

Event handlers subscribe to an event and apply state changes to an aggregate.

Event-driven microservices...

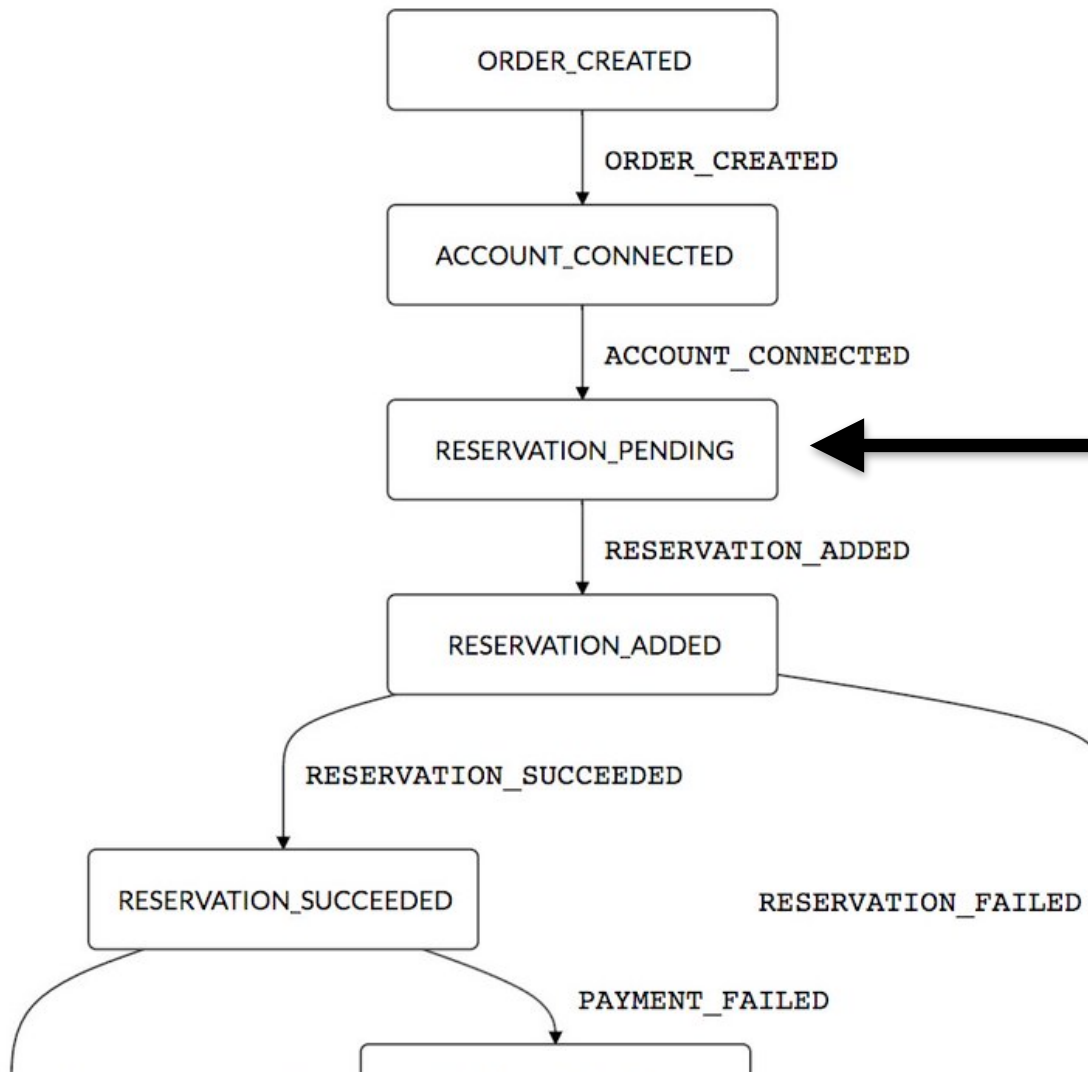

Event handlers use event sourcing to generate the current state of an aggregate.

State Flow

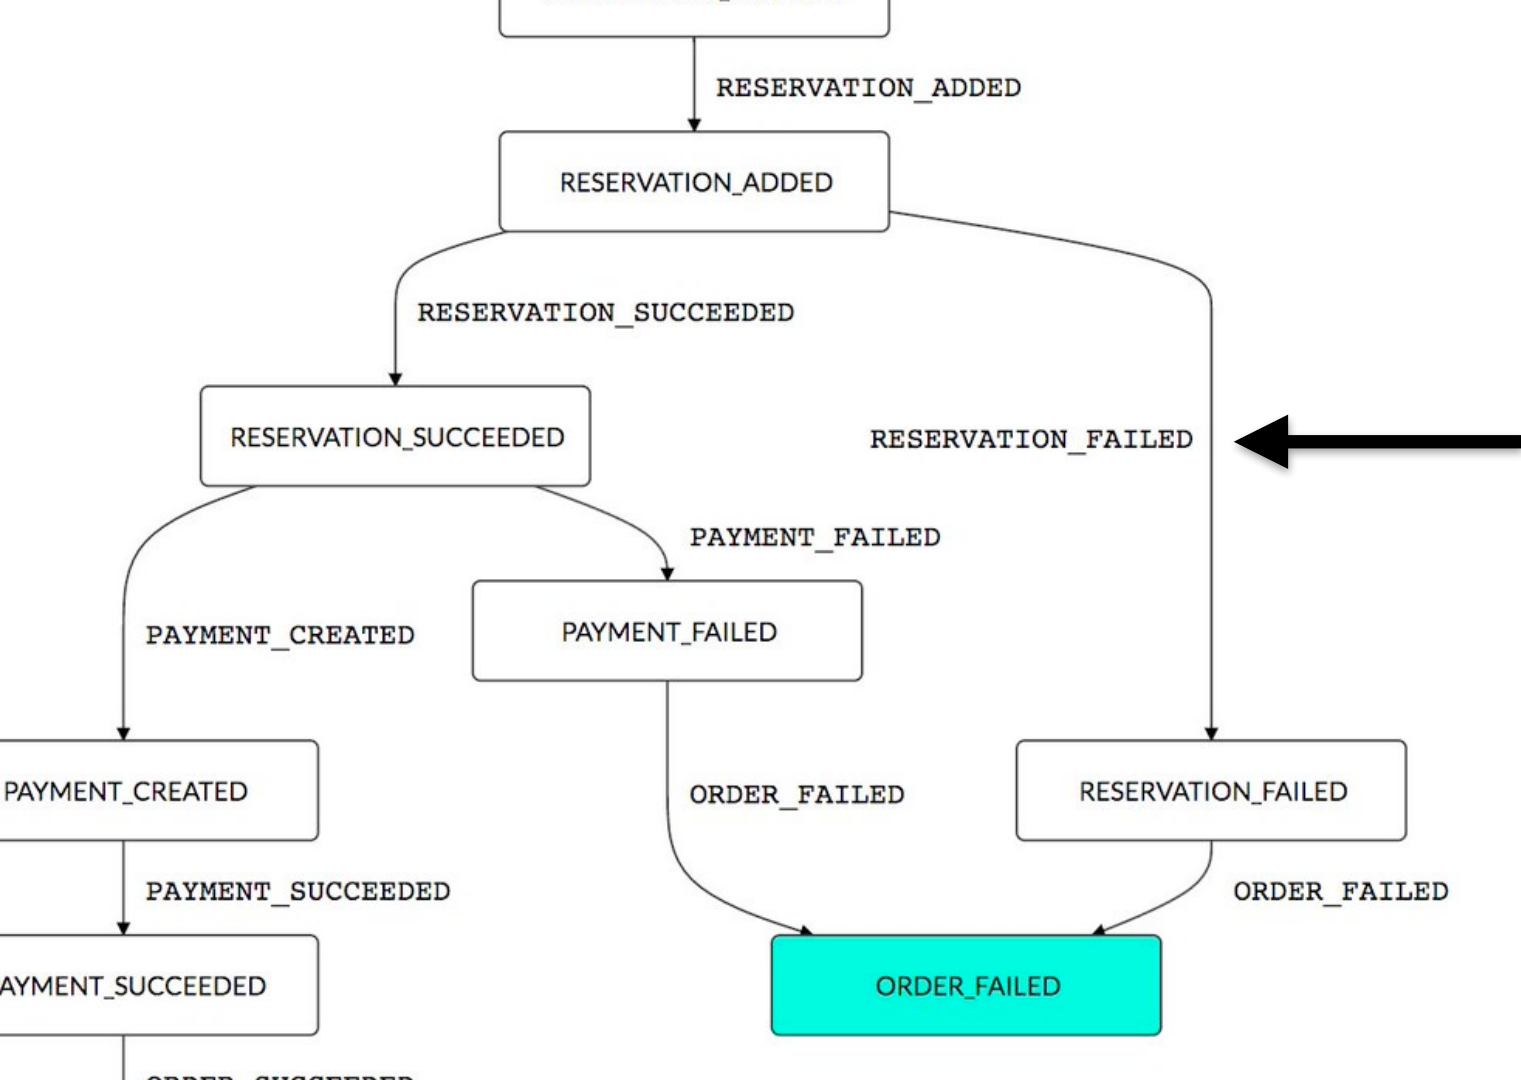

Event-driven microservices...

Event handlers are nodes
on a directed graph.

Event-driven microservices...

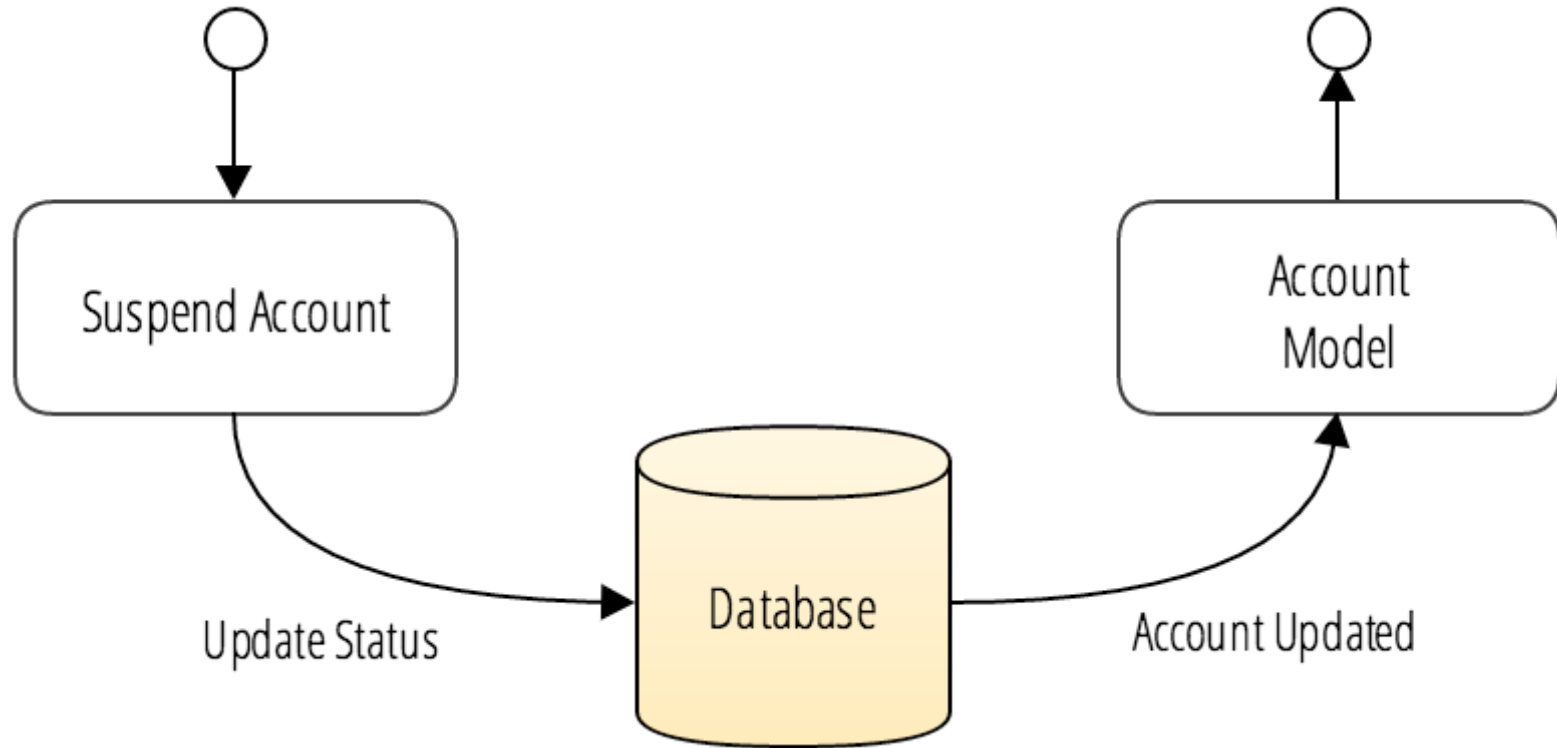

Events are edges on a directed graph.

Event-driven microservices...

CQRS is used to create materialized views from streams of events.

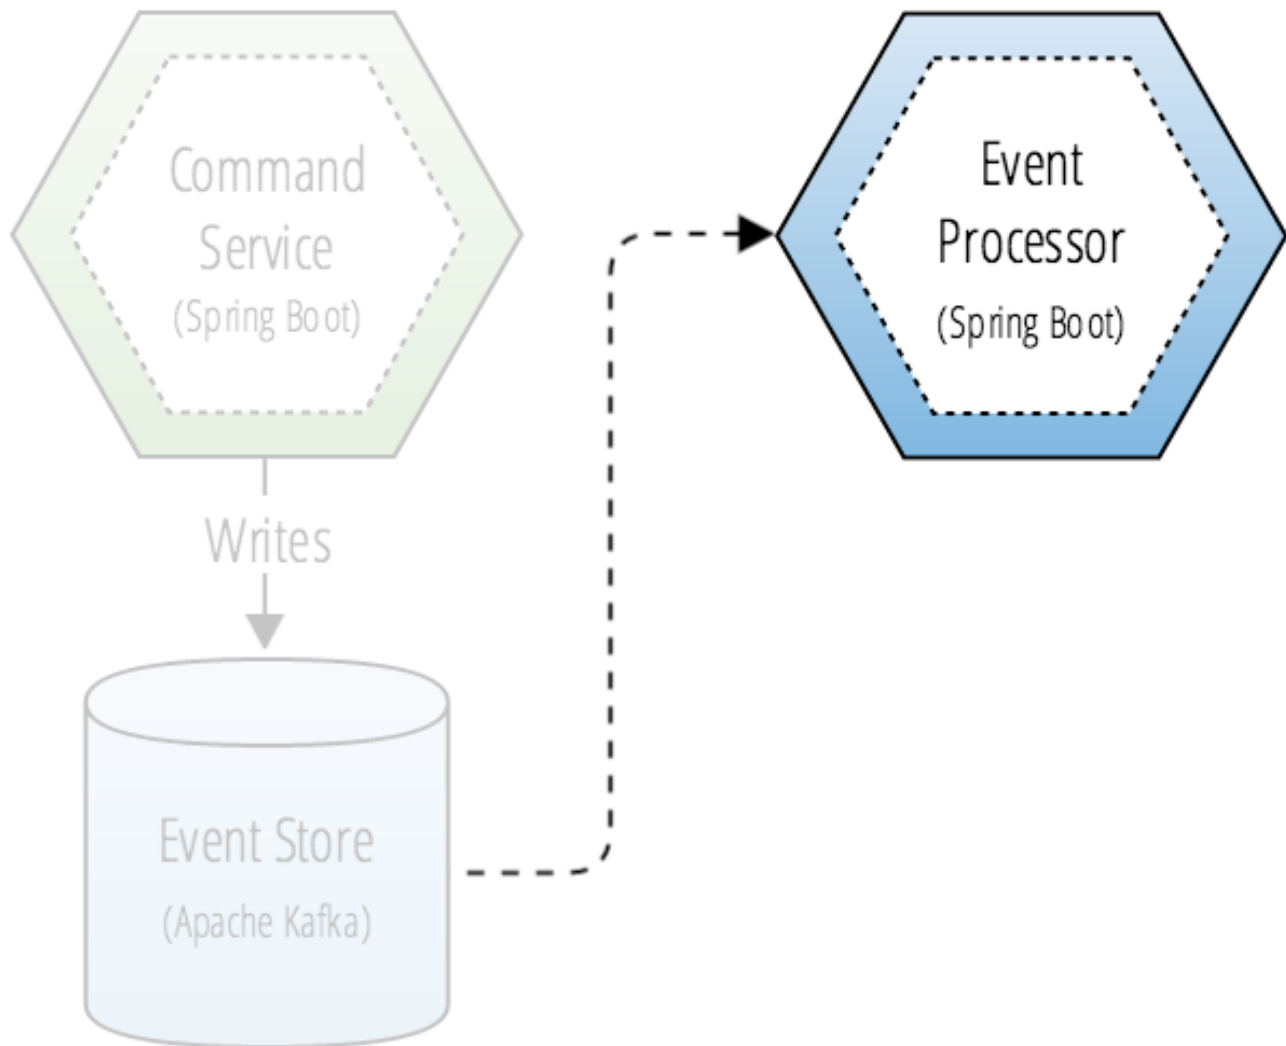

Command Query model

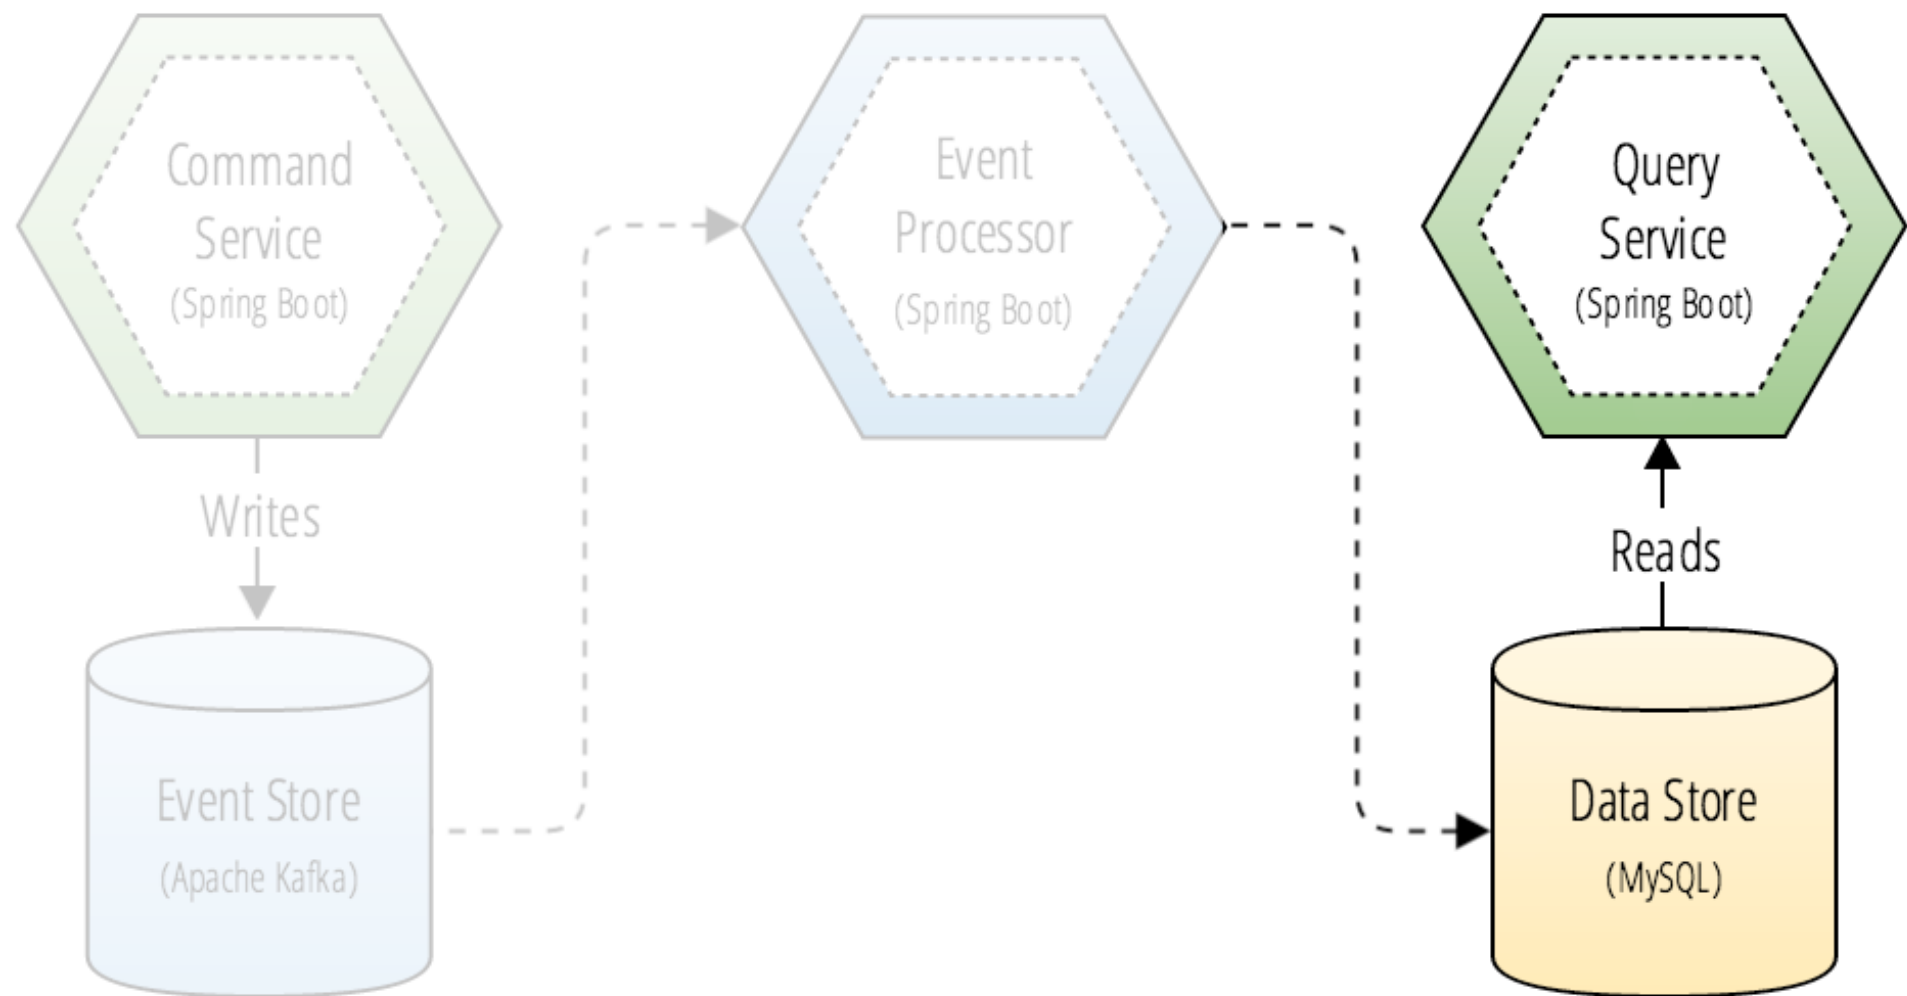

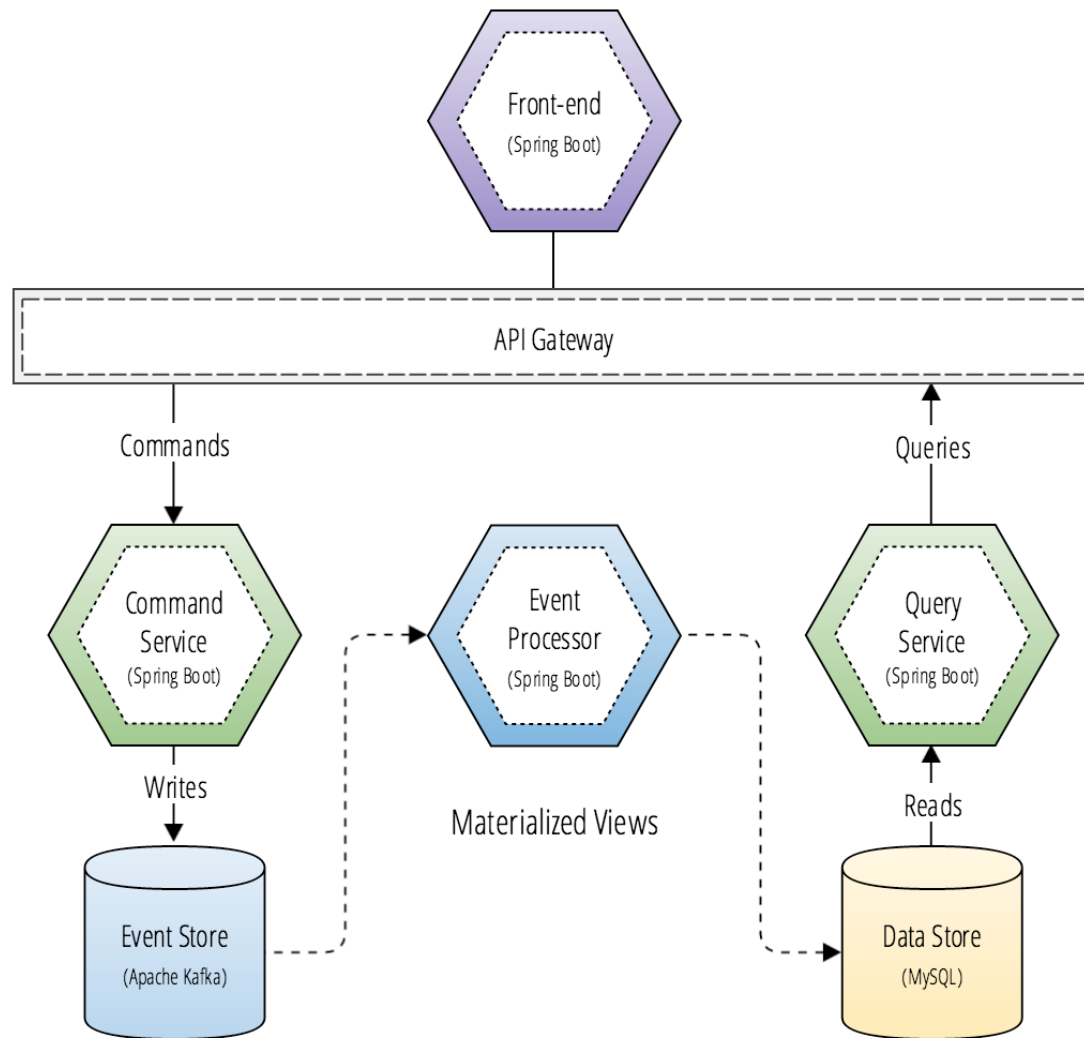

Writes

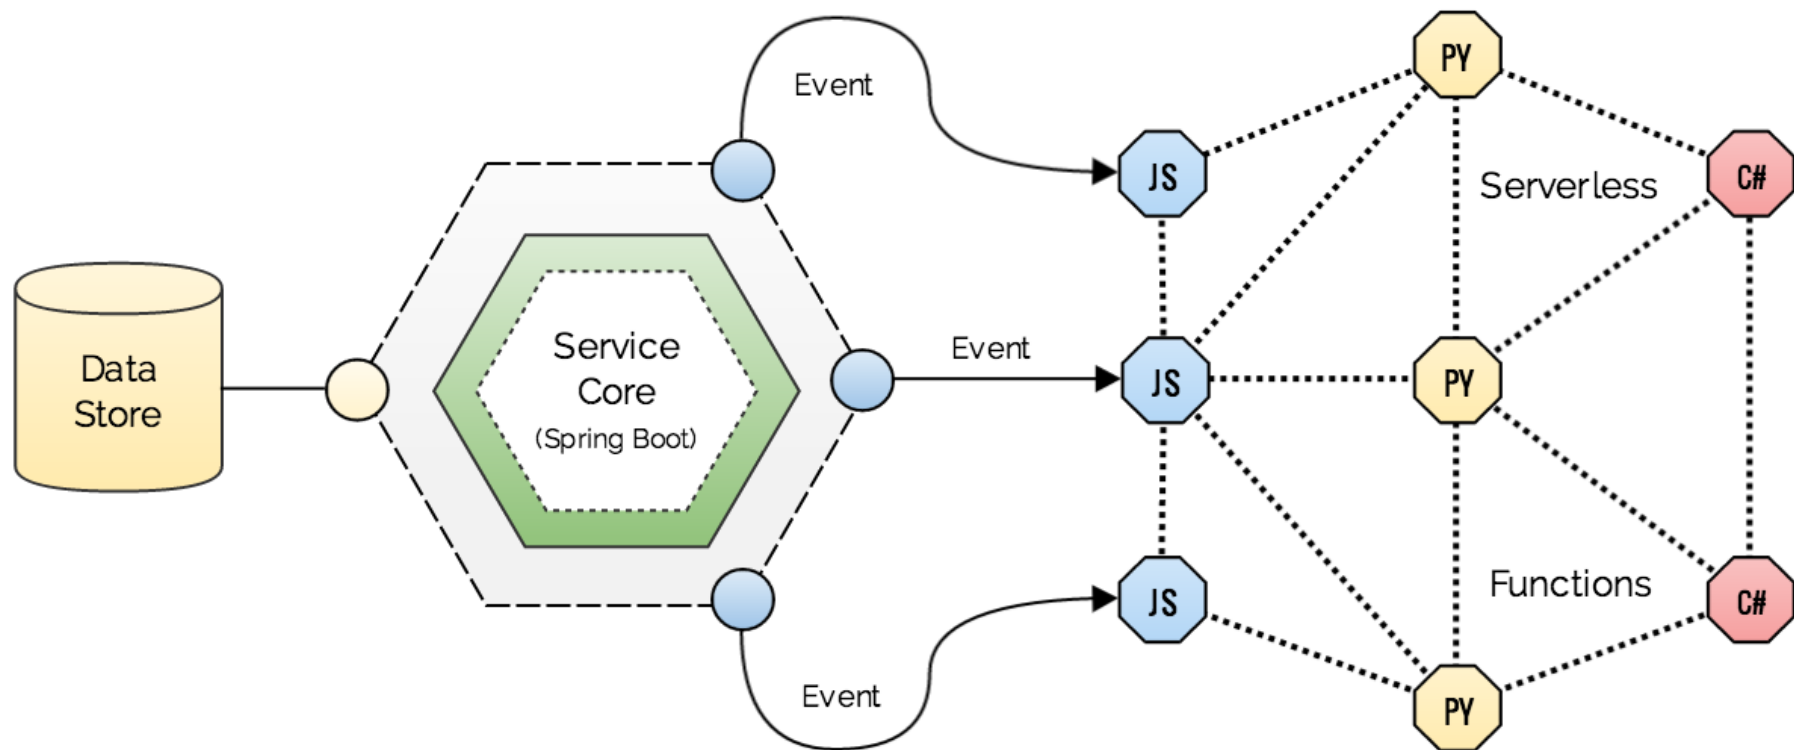

Serverless event handlers

261861622 61601 19001612

Microservices can be event sources

Do what makes sense

But don't build microservices without events
