My Practice

My Practice

Shannon’s Entropy

What you're going to see

in this presentation

- the technical side of creating a proof-of-concept composition
- an artist training a neural network
- data challenges
- infrastructure challenges
- ethical quandaries

What you're not

going to see

- pre-trained, proprietary models
- prompt engineering
- nonconsensual data use
- beautiful code

Outline

1. Background and Goals
2. Data Collection
3. Model Selection
4. Infrastructure
5. Development
6. Deciding When It’s Done
7. Composition

Two Stories of Confusion

Incorrect Assumption #1:
artists != engineers

Incorrect Assumption #2: proprietary models are better

2. Data Collection

Ethical Quandary:
data provenance

Louis Pino + Matti Pulkki

Challenge: data volume

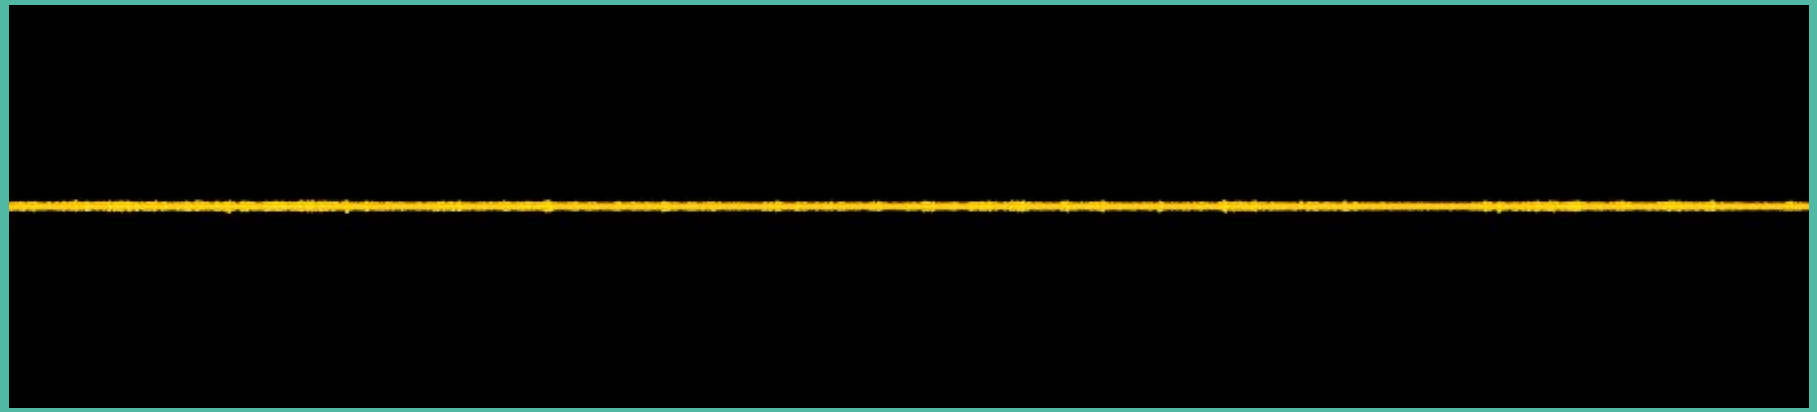
Training Data

- Percussion

- Accordion

Challenge: multi-modal data

Challenge: network too clever



3. Model Selection

"I started with a literature search. I pulled papers on adversarial audio synthesis and a variety of techniques for generation, including some published since January 2021 when I first started playing around with audio generative networks. I did a deep read of the Wavenet paper, and then I realized I may as well start with the structures I already know since I'm unlikely to have time to do a full review of the entire field."

-journal, 10/20/2022

- WaveNet
- DanceDiffusion
- GANSynth
- WaveGAN
- MelNet
- AudioSinGAN
- SampleRNN
- StrawNet (variant of WaveNet)
- RAVE
- Catch A Waveform
- DDSP

- WaveNet (2016)
- DanceDiffusion (2022)

Challenge: lack of time

Challenge: technical debt

2.1 DILATED CAUSAL CONVOLUTIONS

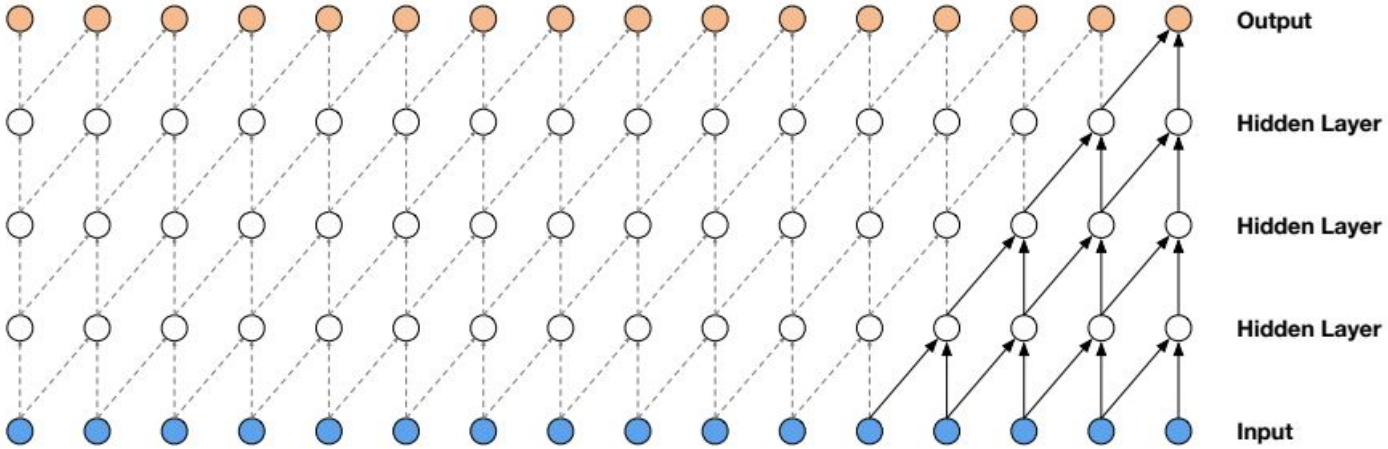


Figure 2: Visualization of a stack of causal convolutional layers.

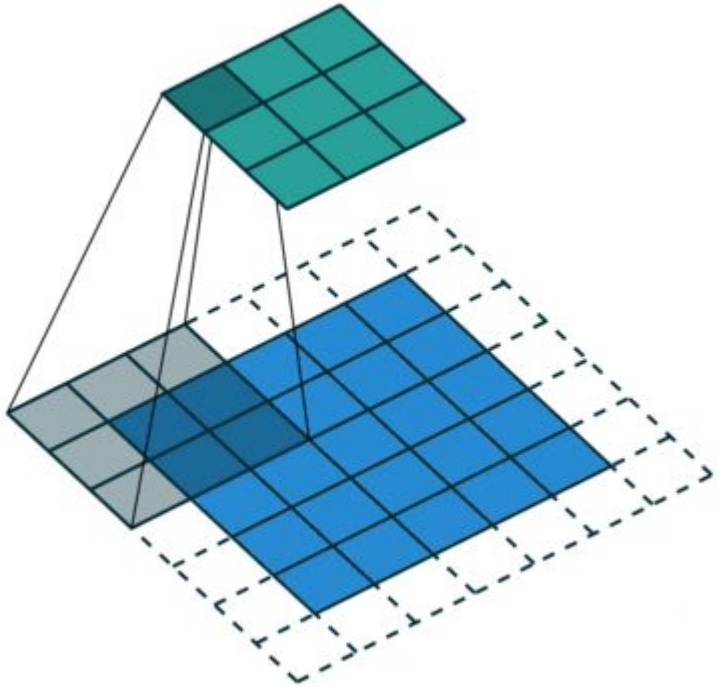
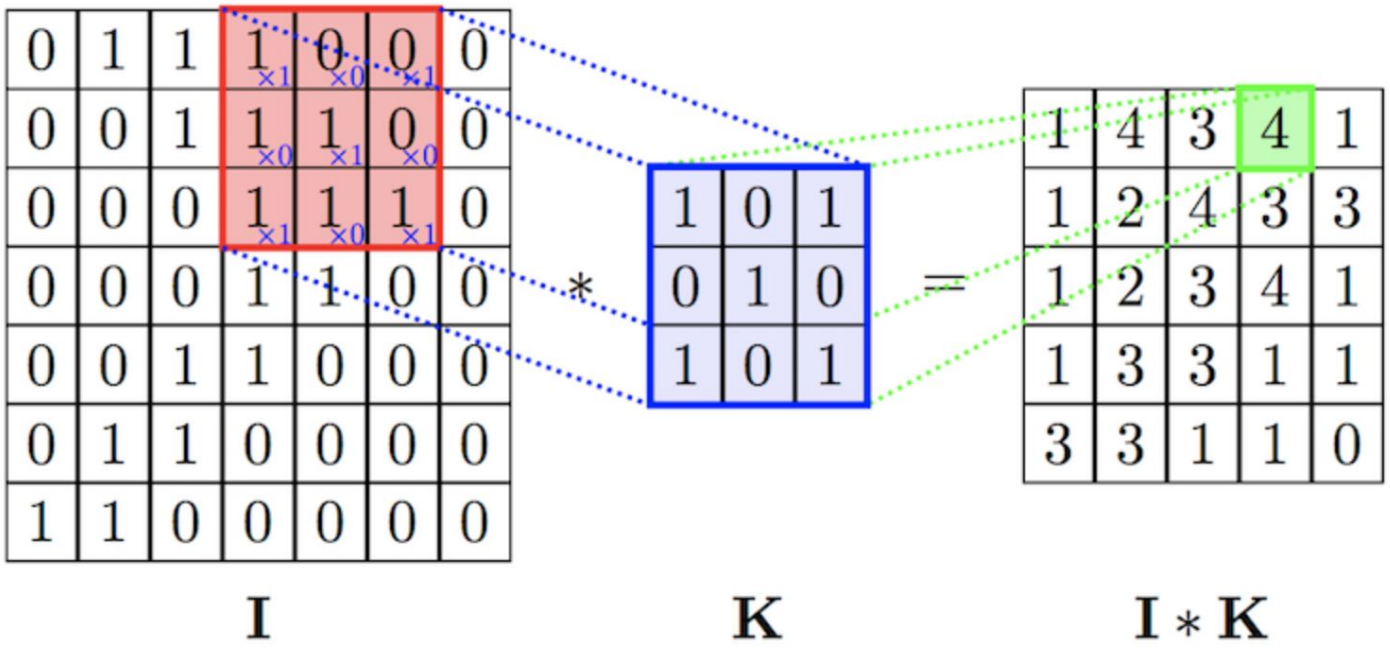
Wavenet Architecture

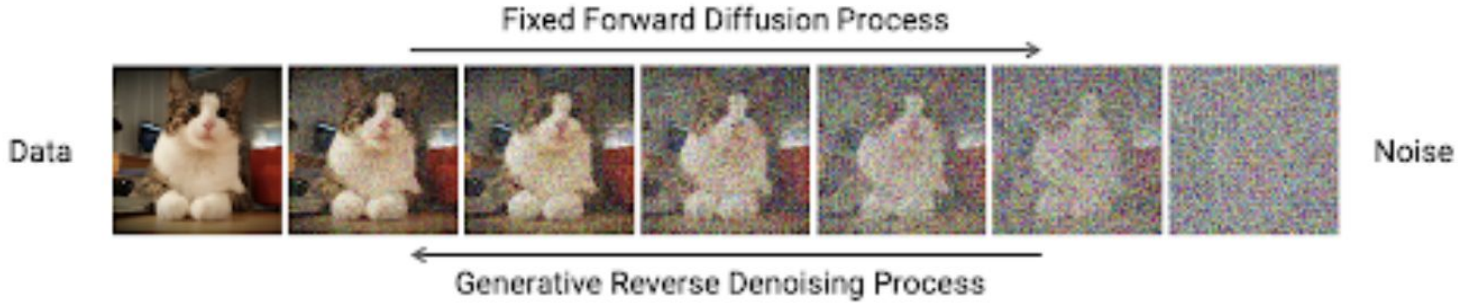


Wavenet Architecture



Wavenet Architecture

DanceDiffusion

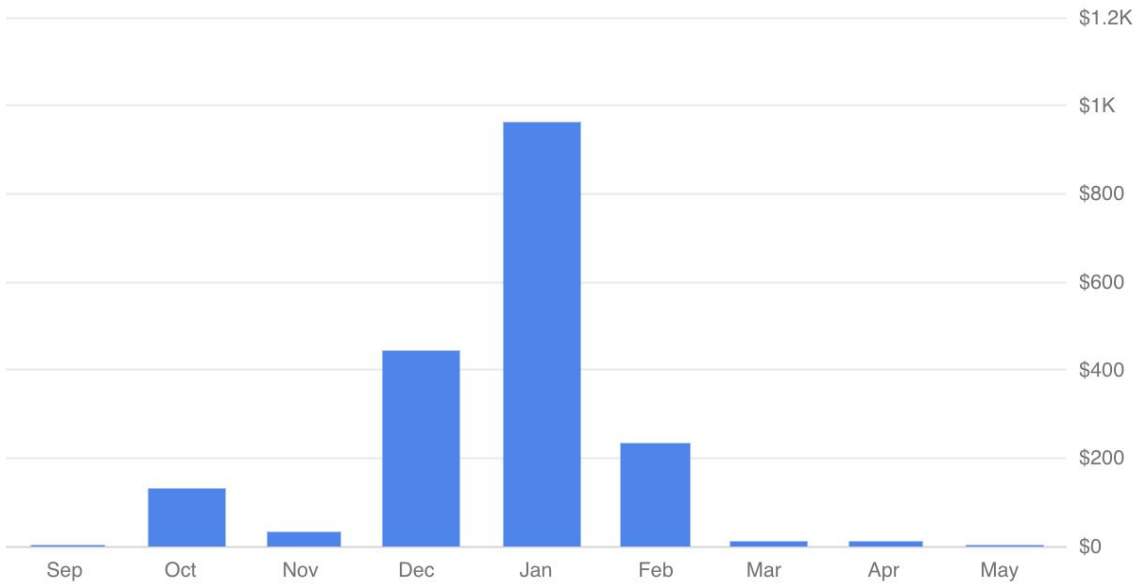


4. Infrastructure

Cloud VMs

- old converted TF + GPUs = hard
- Linux OOM killer = frustrating
- budget limitations = real
- cost structure = stressful + inexact

Cloud VMs



Challenge: MLOps

5. Development

B	C	D	E	F	G	H	I	J	K	L	M	N	O	P
Model	Performer	Data Augmentation	Audio length	Sample rate	Training Steps	Filter width	Initial filter width	Learning rate	Sample Size	Silence Threshold	L2 Strength	Momentum	Loss Behavior	Next Steps
Wavenet (Ibab)	Pino	Trimmed silence, double compressed (Audacity), time shifted, pitch shifted	4.5 hrs	combo 44100 and 22050; set as 22050 in wavenet_params	100,000	2	32	1.00E-04	100,000	0.1	0	0.9	vascillates anywhere from 0.2 up to 4.8	resample the one file to 22050 // triple the amount of audio in there through more augmentation // change sample_size to be one second of audio (22050 samples)
Wavenet (Ibab)	Pino	added Oct resampled to 22050 plus time/pitch shifted versions of Oct	8.25 hrs	22050	100,000	2	32	1.00E-04	22050	0.1	0	0.9	drops to 1.4-3.4 and then vascillates	Will try dropping the learning rate; if this doesn't help, may try increasing the number of training steps OR may try processing Matti's audio and seeing what difference that makes
Wavenet (Ibab)	Pino	added Oct resampled to 22050 plus time/pitch shifted versions of Oct	8.25 hrs	22050	100,000	2	32	1.00E-05	22050	0.1	0	0.9	vascillates more widely between 0.9 and 5	Don't think that will get better with higher # of training steps; will try increasing the sample size
Wavenet (Ibab)	Pino	added Oct resampled to 22050 plus time/pitch shifted versions of Oct	8.25 hrs	22050	100,000	2	32	1.00E-04	250000	0.1	0	0.9	N/A	ran out of memory almost immediately
Wavenet (Ibab)	Pino	added Oct resampled to 22050 plus time/pitch shifted versions of Oct	8.25 hrs	22050	100,000	2	32	1.00E-07	100000	0.1	0	0.9	vascillates between 3 and 5.5	
Wavenet (Ibab)	Matti	silence-removed, plus time and pitch shifted versions	8.25 hrs	22050	100,000	2	32	1.00E-04	100000	0.1	0	0.9	Ugh! It seems to have been converging consistently, loss was down to consistently around 2.0-2.1, and then it was killed for some reason. And when I restarted it with the logdir to continue training, loss went back to vacillating among 3 and 4.4	

Wavenet Architecture

Tunable Hyperparameters

Appendix: Vocabulary

stochastic

involving chance,
randomness, or probability

neural network

definition from IBM

timbre

the quality or tone distinctive of a particular singing voice or musical instrument

(from Merriam-Webster)

hyperparameter

a human-changeable parameter affecting the structure and training of a neural network

as opposed to parameters, which are internal to a neural network and much more numerous

CNN

- convolutional neural network
- a neural network that moves a filter across multi-dimensional input data to detect patterns and structures in it
- commonly used in computer vision
- StatQuest video

RNN

- recurrent neural network
- a neural network that contains cyclical node references/feedback loops, allowing it to remember previous time steps
- commonly used for time series data and language processing
- StatQuest video

LSTM

- long short-term memory
- a fancy type of RNN that has a longer memory and also gates that control its ability to forget
- often used for natural language processing (NLP)
- StatQuest video

Algorithmic Composition

“"Supposing, for instance, that the fundamental relations of pitched sound in the signs of harmony and of musical composition were susceptible of such expression and adaptations, the engine might compose elaborate and scientific pieces of music of any degree of complexity or extent"

-Ada Lovelace, 1843

WOLFGANG AMADEUS MOZART
